CLAIMS

What is claimed is:

1. An event ordering system, comprising:

a constraint component that receives temporal constraints associated with a plurality of events; and

an order component that determines an event order in accordance with the temporal constraints, wherein the event order specifies the execution order of events.

- 2. The system of claim 1, wherein the constraint is an event start and/or a stop time.
- 3. The system of claim 1, wherein the constraint is event duration.
- 4. The system of claim 1, wherein the constraint is a filter.
- 5. The system of claim 1, further comprising a system information component that provides information about an execution system to the order component to facilitate selection of an optimal event order.
- The system of claim 5, the information about an executing system includes available memory.
- 7. The system of claim 5, the information about an execution system includes data throughput rate.
- 8. An interactive event ordering system, comprising:
- a display component that provides a plurality of object workspaces, the workspaces including at least one of a past, present and/or future space, the present space is an editable area; and
- a design component that temporally associates and/or disassociate objects in the editable area.

- 9. The system of claim 8, object workspaces are user interfaces that facilitate a graphical-based approach to specify relationships amongst objects.
- 10. The system of claim 8, non-associated objects order of execution is determined via utility-based analysis.
- 11. The system of claim 8, non-associated objects are executed randomly.
- 12. The system of claim 8, the design component comprising a specification component that receives hard start and/or end times for events associated with objects.
- 13. The system of claim 8, the design component temporally associates objects as a function of respective location in the editable area.
- 14. The system of claim 8, further comprising a duration component that receives information regarding event duration.
- 15. The system of claim 8, the design component receives and executes information related to nested events associated with respective objects.
- 16. The system of claim 8, further comprising a policy component that applies predefined rules to execution of the objects.
- 17. The system of claim 8, further comprising a policy component that applies predefined rules to editing of the objects.
- 18. The system of claim 8, the design component receives and executes information regarding hierarchical relationship of respective objects.

- 19. The system of claim 8, the design component receives and executes information regarding dependency relationship of respective objects.
- 20. The system of claim 8, further comprising a query component that searches for events that satisfy a query, and displays objects associated with the events in temporal order.
- 21. The system of claim 22, the query component provides context information for respective objects.
- 22. The system of claim 8, objects placed in the past area are executed prior to objects in the present area.
- 23. The system of claim 8, objects placed in the future area are executed after objects in the present area.
- 24. The system of claim 8, the design component associates objects in a non-linear conditional manner.
- 25. The system of claim 8, the design component associates objects via iterative loops.
- 26. The system of claim 8, the design component associates objects based on a specified version.

27. A method for ordering events comprising: receiving temporal constraints associated with a plurality of events; generating one or more event execution orders in accordance with the constraints; and

selecting an optimal event order based at least in part on execution system information.

- 28. A computer readable medium having stored thereon computer executable instructions for carrying out the method of claim 27.
- 29. A method for object authoring comprising:
 receiving object data associated with events from a workspace including at least
 one of a past, present, and future area; and,
 associating objects temporally based at least in part upon relative object locations;
- 30. The method of claim 29, further comprising associating objects based on one or more operational objects.
- 31. The method of claim 30, wherein the operational objects correspond to a loop.
- 32. The method of claim 30, wherein the operational objects corresponds to a trigger.
- 33. The method of claim 30, wherein the operational objects correspond to a conditional.
- 34. The method of claim 30, wherein the operational objects correspond to hard start and/or stop times.
- 35. The method of claim 29, wherein objects are associated in a non-linear conditional manner.

- 36. The method of claim 29, wherein the objects are associated via iterative loops.
- 37. The method of claim 29, further comprising determining the execution order of events based on object associations.
- 38. A computer readable medium having stored thereon computer executable instructions for carrying out the method of claim 29.
